

Note: This is Online Appendix 1 of Woodford, D.J., South, J., Mofu, L. & Pegg, J., 2024,
‘River hydrology mediates fish invasions in Addo Elephant National Park, South Africa’,
Koedoe 66(1),a1806. <https://doi.org/10.4102/koedoe.v66i1.1806>

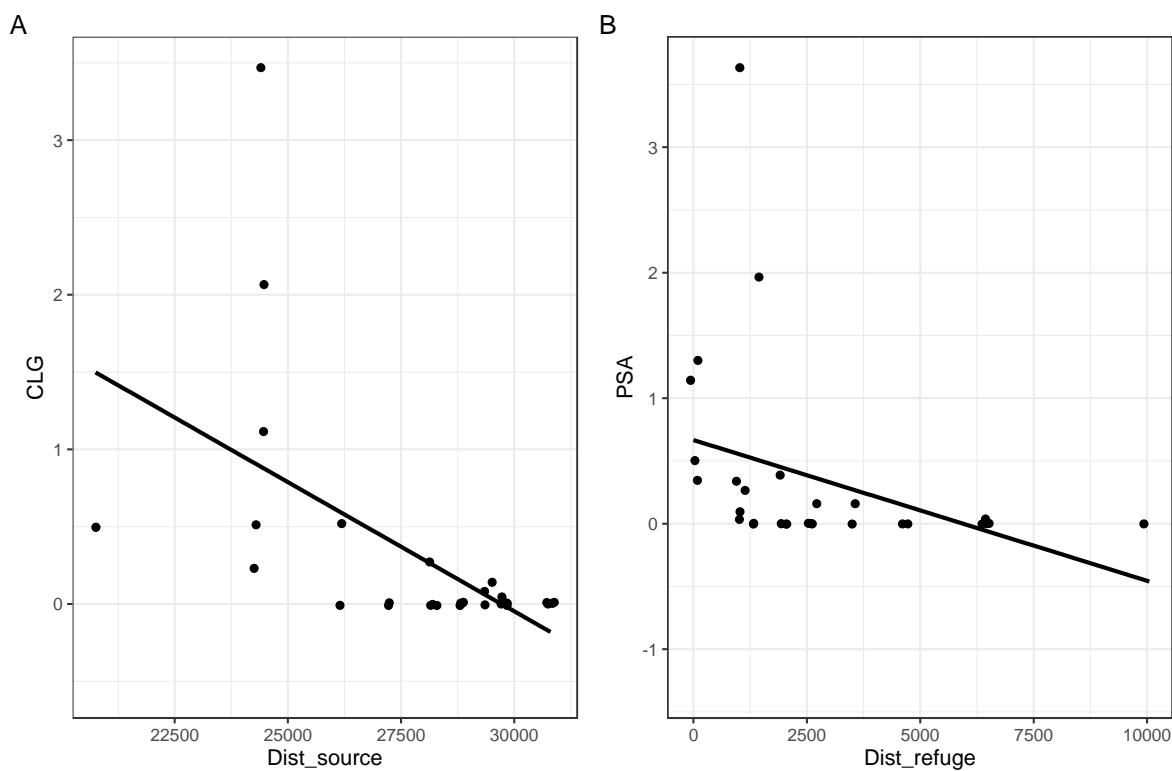

Figure S1: Linear regressions of A) extra-limital *Clarias gariepinus* mean standardised catch to distance from source (m) and B) *Pseudobarbus afer* mean standardised catch to distance to refuge (m) in the Coerney River

Table S1: Summary statistics for SIMPER analysis on the taxa driving dissimilarity between “extra-limital” and “native only”, as well as between “native only” and “bass” fish assemblages in rivers inside Addo Elephant National Park. Grey cells indicate fish species† whose relative abundance (Mean Standardised Catch) contributed the most to separation between the fish assemblages being contrasted.

Contrast: Native only vs Extralimital							
Species	average	sd	ratio	ava	avb	cumsum	p
